RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 46 pages. Original publisher: Aberdeen Proving Ground, MD : Army Research Laboratory, 1999 OCLC Number: (OCoLC)308722675 Subject: Composite materials. Excerpt: . . . For an isotropic region, equations (5x9) can be greatly reduced and simplified since the material properties are the same in hoop and axial directions (i. e. , D, D, , Es E X, and v, , v, ,). Accordingly, the critical velocity can be expressed as 2. 3 Finite Element Modeling. The closed-form solution described in section 2. 1 can be applied accurately to a cylindrical shell under the assumption of infinite length. For a finite length cylinder with varying cross-sectional area along its length and multimaterial construction, the fmite element method allows for a more expedient and straightforward procedure for determining the critical velocity. A hydrodynamic finite element code, DYIWUD, was modified to simulate the moving-pressure boundary condition. As shown in Figure 1, a slideline that allows a dummy material block to move freely along the axial direction of the cylinder is included in the fmite element model of the cylinder. The instantaneous location of the pressure front is then easily determined by tracking the To accurately capture the oscillatory dynamic location of the rear face of the dummy material block. response of the tube, the computation is carried out with a very small time interval (10 s). This time interval also allows the pressure to slowly ramp to a maximum value as element surfaces are uncovered by the moving block. This means that artificial numerical stress oscillations, due to the sudden application of the pressure boundary condition on an element face, are minimized so that these numerical oscillations do not adversely affect the solution. While for the...
